trapezoid: The Trapezoidal Distribution

Jeremy Thoms Hetzel

September 12, 2011

1 Introduction

The trapezoidal distribution is defined by minimum, lower mode, upper mode, and maximum parameters. The generalized trapezoidal distribution adds three more parameters: the growth rate, decay rate, and boundary ratio parameters. Van Dorp and Kotz[2] and van Dorp and colleagues[1] formally describe the generalized trapezoidal distribution, representing the minimum, lower mode, upper mode, maximum, growth rate, decay rate, and boundary ratio with parameters $a, b, c, d, m, n,$ and α, respectively.

The probability density function of the generalized trapezoidal distribution with parameters $a, b, c, d, m, n,$ and α is given by:

$$f_X(x \mid \theta) = \mathcal{C}(\Theta) \times \begin{cases} \alpha \left(\frac{x-\alpha}{b-\alpha} \right)^{m-1}, & \text{for } a \leq x < b \\ (1-\alpha) \left(\frac{x-b}{c-b} \right) + \alpha, & \text{for } b \leq x < c \\ \left(\frac{d-x}{d-c} \right)^{n-1}, & \text{for } c \leq x \leq d \end{cases}$$

with the normalizing constant $\mathcal{C}(\Theta)$ defined as:

$$\mathcal{C}(\Theta) = \frac{2mn}{2\alpha \left(b - a \right) n + \left(\alpha + 1 \right) \left(c - b \right) mn + 2 \left(d - c \right) m}$$

and where the parameter vector $\Theta = \{a, b, c, d, m, n, \alpha\}, a \leq b \leq c \leq d,$ and $m, n, \alpha > 0$.

The trapezoid package provides functions for the probability density function (dtrapezoid), cumulative distribution function (ptrapezoid), quantile function (qtrapezoid), and random generation (rtrapezoid). The parameters $a, b, c, d, m, n,$ and α are specified by the arguments min, mode1, mode2, max, n1, n3, and alpha, respectively. The argument names were chosen to avoid conflicts with names that commonly have specific meaning in R functions, such as c and n.

2 Examples

2.1 Trapezoid

The generalized trapezoidal distribution simplifies to the trapezoidal distribution when $m = n = 2$ and $\alpha = 1$.

```
> require(trapezoid)
> require(ggplot2)
> x <- seq(from = 0, to = 1, by = 0.01)
> density <- dtrapezoid(x, min = 0, mode1 = 1/3, mode2 = 2/3,
      max = 1, n1 = 2, n3 = 2, alpha = 1)
> trapezoid <- ggplot(data = data.frame(x, density), aes(x = x,
      y = density)) + geom_line() + theme_bw()
> print(trapezoid)
```
Figure 1: A trapezoidal distribution.
2.2 Triangle

The trapezoidal distribution further simplifies to the triangular distribution when $b = c$.

```
> x <- seq(from = 0, to = 1, by = 0.01)
> density <- dtrapezoid(x, min = 0, mode1 = 1/2, mode2 = 1/2,
      max = 1, n1 = 2, n3 = 2, alpha = 1)
> triangle <- ggplot(data = data.frame(x, density), aes(x = x,
      y = density)) + geom_line() + theme_bw()
> print(triangle)
```

Figure 2: A triangular distribution.

2.3 Generalized trapezoidal distribution

Parameters m, n, and α control the growth rate, decay rate, and boundary ratio, respectively, of the distribution. In the trapezoid package, these

parameters are controlled by the `n1`, `n3`, and `alpha` arguments. To demonstrate the effects of these three parameters, van Dorp and Kotz[2] generated eight distributions with varying parameter values. The distributions are approximately re-generated here.

```
> x <- seq(from = 0, to = 1, by = 0.01)
> arguments <- list()
> arguments[["A"]] <- list(x = x, n1 = 2, n3 = 2, alpha = 0.8)
> arguments[["B"]] <- list(x = x, n1 = 1.5, n3 = 1.5, alpha = 1)
> arguments[["C"]] <- list(x = x, n1 = 2.5, n3 = 2.5, alpha = 1.5)
> arguments[["D"]] <- list(x = x, n1 = 1.5, n3 = 2.5, alpha = 0.5)
> arguments[["E"]] <- list(x = x, n1 = 2.5, n3 = 1.5, alpha = 1)
> arguments[["F"]] <- list(x = x, n1 = 0.5, n3 = 0.5, alpha = 1.5)
> arguments[["G"]] <- list(x = x, n1 = 1.5, n3 = 0.5, alpha = 0.5)
> arguments[["H"]] <- list(x = x, n1 = 2.5, n3 = 0.5, alpha = 1)
> arguments[["I"]] <- list(x = x, n1 = 0.5, n3 = 1.5, alpha = 1.5)
> arguments[["J"]] <- list(x = x, n1 = 0.5, n3 = 2.5, alpha = 0.5)
> plot.data <- ldply(arguments, function(z) {
      x <- z$x
      density <- dtrapezoid(x = z$x, min = 0, mode1 = 0.2,
          mode2 = 0.8, max = 1, n1 = z$n1, n3 = z$n3, alpha = z$alpha)
      args <- paste("n1 = ", z$n1, ", n3 = ", z$n3, ", alpha = ",
          z$alpha, sep = "", collapse = "")
      out <- data.frame(x, density, args)
 })
> plot.data$label <- paste(plot.data$.id, ": ", plot.data$args,
      sep = "")
> generalizedTrapezoids <- ggplot(data = plot.data, aes(x = x,
      y = density)) + geom_line() + theme_bw() + facet_wrap(~label,
      ncol = 2, scales = "free_y")
> print(generalizedTrapezoids)
```
